

Creating documentation

Directory format

All documentation files to be compiled in this repository follow the format of:

`documentation/**/main.typ`

The directory structure above the file is used to determine the output name. For instance, in the case of this file:

`documentation/meta/creating_documentation/main.typ`

→ **`output/meta/creating_documentation.pdf`**

You can use the directory to store any other files needed for the documentation file. The build script will compile all `main.typ` files and ignore anything else. Directories that don't contain a `main.typ` will not be created in the output (unless they have a subdirectory that does have a `main.typ`).

For instance, the following vector image of a startled kettle is in `documentation/meta/creating_documentation/kettle-alert.svg`, used here under the MIT/Apache 2.0 license from the [Pictogrammer's Material Design Icon](#) set.

Figure 1: A startled kettle.

Files that are frequently shared amongst files are found in the universal directory. You can reference these files as well in documentation. For instance, here is the Helping Hands logo:

Figure 2: Helping Hands logo.

To contribute documentation, create a pull request against the source branch.

Some inputs from the build process are available for use in documentation. For instance, this output PDF was compiled at 2026-03-01T21:12:49.962444+00:00.
